Abstract

When looking at the integration of advanced digital technologies in the world of work, Denmark is a crucial country to consider not only for its open approach to innovation but also for the key role of industrial relations and social dialogue in shaping and regulating the labour market. First, Denmark is one of the most digitalised societies in the world; and this is also the case in the Danish labour

market, where automation and the use of AI tools is widespread. Second, the Danish model of labour market regulation is voluntarist, with most regulation

taking place via collective agreements negotiated between unions and employer associations, and employment legislation playing only a limited role. This is also the case for European Union (EU) directives which have often been implemented via collective agreements with legislation used as a supplementary method of transposition.

Section 1 of the chapter presents recent trends regarding algorithmic management (AM) and artificial intelligence (AI) in the Danish labour market. Section 2 introduces the general framework for regulating AM and AI in the Danish model including important historic examples of collective agreements and labour law, while Section 3 presents recent social dialogue initiatives in the platform economy at sector or company level involving highly digitalised companies. While the main focus of the book is the conventional economy, this chapter places emphasis on examples emerging from platform work which is where, in the Danish context, the most advanced provisions related to the introduction of AM and AI are emerging. In particular, it presents the well-known 'Hilfr2' agreement negotiated between Hilfr, a platform for cleaning in private households, and 3F, the largest trade union for skilled and unskilled workers in Denmark (Ilsøe 2025). By examining the forms of AI governance taking shape in the platform economy, the chapter aims to shed light on the emerging Danish approach to regulating digital technologies which is expected to extend its influence to more conventional industries once these have finalised their collective agreements concerning AI governance. In pointing towards the conclusion, Section 4 discusses the potentials and pitfalls in the Danish examples of collective agreements and labour law with relevance for AM and AI.
